

FACTOR V BY PCR (FVPCR)

Normal
Factor V Gene Mutation Analysis: Useful for confirming the diagnosis of resistance to Activated Protein C (APC) as identified by functional coagulation testing. It can also be used to establish the diagnosis of APC resistance when functional coagulation testing may not be feasible, for example, patients on anticoagulant therapy or positive for Lupus Anticoagulants. An interpretive report will be provided. Call 263-4017 for additional information.
